

4 ways **digital monitoring** can help you spot **cyberbullying**.

#AntiBullyingWeek

Looking to help your school **tackle cyberbullying**?

Being able to identify harmful behaviours has become critical for schools and colleges to quickly intervene and guarantee student wellbeing. Through ground-breaking technology that combines AI, human expertise and alert notifications, digital monitoring can offer an additional layer of protection to students and staff by making the invisible visible. How can digital monitoring spot cyberbullying?

Online conversations

While monitoring conversations in online chats, social media platforms and forums, digital monitoring tools will determine harmful behaviours such as insults, false accusations or misinformation.

Threats

By analysing social networking sites, the technology will also quickly identify threats made to students.

Self-harm

By capturing bullying evidence left on various online platforms, digital monitoring will pinpoint the students considering self-harm after a cyberbullying incident that happened on non-monitored devices.

Witnesses

While investigating blogs, emails, online documents, and social media, algorithms will spot the students who have witnessed cyberbullying incidents.
